A Study of the Relationship between Work Engagement and Job Satisfaction in Private Companies in Kurdistan

Kofand Anwar (PhD) 1, Goran Hussein Qadir2

1Chairman of Business, Lebanese French University, Erbil-Kurdistan
2Accounting and finance, Lebanese French University, Erbil-Kurdistan

Abstract— The purpose of this study is to investigate the relationship between work engagement and job satisfaction. The research aimed to examine each of (equal opportunities, personal influence, nature of career, development opportunity, employee recognition, work challenge, supervisor behaviour, ethics and integrity, and job empowerment) and its relationship with job satisfaction in private companies in Erbil. The researcher used quantitative research method in order to measure the relationship between work engagement and job satisfaction, however only 108 respondents were participated in the current study. The researcher used multiple regression analysis to measure the relationship among variables. The researcher found that workplace challenge had the highest value among other work engagement elements = .671 and P-value = .000 which indicates that many private companies’ employees are engaged to their job because of time management. Overwhelming workloads and communication. This research highlighted the significance of workplace challenge that inspires the individuals to be more engaged to their organization. Employee engagement is a positive attitude towards the workplace and is the degree that an individual is bind to the organization. Only small number of employees had participated in this research from private companies in Kurdistan, which limits the outcome of the study.

Keywords— Engagement, Job satisfaction, Kurdistan.

I. INTRODUCTION

Improved employee engagement can be both physical and mental, reflecting the behavioural and attitudinal fundamentals of the concept. In today’s competitive environment there is a considerable body of indication representing the advantages to businesses of having strongly engaged employees. Several academician and scholars proved that engaged employees less likely will leave the organization for instance (Andrew, et al., 2017), meanwhile; according (Li, et al., 2017), engaged employees will attend regularly. Nowadays, none of the businesses can survive without work engagement. Therefore, it is significant to recognize the conception of engagement and its possible consequence. According to (Moura, et al., 2014), engagement is a belief that demonstrates individual’s strength of attachment to an organization. The purpose of this study is to identify the relationship between work engagements with job satisfaction in private universities in Kurdistan.

II. LITERATURE REVIEW

According to Yuang, et al., (2016), employee engagement refers to individuals’ participation or attachment to the organizations. According to (Ilkhanizadeh, and Karatepe, 2017), employee engagement is an effective reaction to the entire organization and the degree of employees’ loyalty to their organization. According to Mróz, and Kaleta, (2016), employee engagement is basically employees’ attitude to organization. According to (Orgambídez-Romsa, and Almeidab,2017), employee engagement is a psychological degree which describes the individuals’ relationships with the organization and has associations to continue as a member in the organization. According to (Wingerden, et al., 2017), employee engagement is the degree to which the individuals have strong attachment to their organization. As per (Orgambídez-Ramos, et al.,2014) stated employee engagement is significant for every organization, because high levels of employee engagement results in higher level of job satisfaction. According to (Lu, et al., 2016) engaged employees mostly have no intention to quit their job. (Rayton, & Yalabik, 2014), proved a negative relationship between employee commitment and employee turnover intentions, furthermore they proved a positive and significant relationship between work engagement and job satisfaction. On the other hand many academic scholars proved a positive relationship between employee
engagement and employee satisfaction (Kooij, et al., 2017). Organizations can benefit from engaged employees in many ways for instance, reducing employee turnover and increasing level of job satisfaction (Karanika-Murray, et al., 2015). According to (Bakker, and Demerouti, 2017), there is an argue as to whether work engagement is pointed out as behaviour or attitude statement in terms of psychological view, however (Lu, et al., 2014) stated that work engagement can be viewed as both psychological statements therefore it could be behaviourally and attitudinally stated for the aimed of the current research and in line with a strong literature, the researcher pointed out the work engagement as an affective-motivational state. Knight, et al., (2017), defined job satisfaction as emotion or feeling that an employee has regarding current job. Also, they pointed out that many academic scholars tried to determine several job satisfaction components, assess relative significance for each job satisfaction components and investigate the influence of all these job satisfaction components on employee’s satisfaction and productivity. According to Trochimiuk, (2015), stated that professional development for employees will lead to increase their level of commitment and be more engaged to their tasks and duties. According to Karatepe, and Olugbade, (2016), job satisfaction defined as individual’s overall attitude toward job. Boamah, et al., (2017), stated that inspiration is closely associated to job satisfaction. Many factors are related to job satisfaction for instance, social relationships, job analysis, employee training, desires and needs, recruitment and selection, orientation, working conditions, development and quality of management. (Aunola, et al., 2016). Furthermore, it has been pointed out that several researcher and academicians attempted to determine several job satisfaction components, assess relative significance for each job satisfaction components and investigate the influence of all these job satisfaction components on employee’s satisfaction. Job satisfaction is an attitude which is an outcome of outline and consistent of many precise likes and dislikes experiences with the job. According to Pawłowska and Zdziarski (2015), stated that the most important and essential asset for almost all organization is human resource. A job satisfaction for an individual considers as a degree of satisfaction and it depends on the job. Job satisfaction is a vital pointer of how an individuals’ feel regarding of the job and defines how much they are satisfied with their job. The level of satisfaction of individuals linked with rise of organizational output. Job satisfaction of an individual considers an important factor is to the achievement of an organization. In every organization a high rate of individuals’ satisfaction is strongly correlated with a low level of employee turnover. Therefore, keeping individuals happy and satisfied with their present job would be a leading priority for every organization. Human resource management practices attempt to allocate and assign the human capital in the great potential ways to attain long term organizational objectives, they offer penalty of advantages and benefits resulting increasing level of job satisfaction (Vera, et al., 2016). Moreover, according to Bartak and Jabłoński, (2016) motivated employees are expected to be more engaged and committed to their duties and responsibilities.

III. CONCEPTUAL FRAMEWORK

Research Model

![Conceptual Framework Diagram]
Research Hypotheses

H1: Work engagement mediates the positive relationship between equal employee opportunities (fair treatment) and job satisfaction.

H2: Work engagement mediates the positive relationship between personal influence and job satisfaction.

H3: Work engagement mediates the positive relationship between nature of career and job satisfaction.

H4: Work engagement mediates the positive relationship between development opportunity and job satisfaction.

H5: Work engagement mediates the positive relationship between employee recognition and job satisfaction.

H6: Work engagement mediates the positive relationship between workplace challenge and job satisfaction.

H7: Work engagement mediates the positive relationship between supervisor behaviour and job satisfaction.

H8: Work engagement mediates the positive relationship between ethics and integrity and job satisfaction.

H9: Work engagement mediates the positive relationship between job empowerment and job satisfaction.

Methodology

The researcher used a quantitative research method to test the developed research hypotheses. Currently there are 8622 private companies registered in the Erbil Chamber of Commerce & Industry, these including general trade companies and other specialized companies. Based on the participants’ request, the researcher kept companies identity confidentially; therefore the researcher kept any identifying information out of published reports. The researcher distributed 120 surveys at private companies in Kurdistan; however only 108 surveys were filled and received back from the participants, therefore the sample size for the current study is 130 participants.

As seen in table (1) demographic analysis for respondents participated in this research. Based on to the descriptive analysis, the researcher was able to analyze respondents’ background information. Concerning the respondents’ gender; it was found that 76 male from total of 108 respondents participated in this research and 32 female from total of 108 respondents participated in this research. Concerning the respondents’ age; it was found that 16 from total of 108 respondents fall in a group of 20-25 years old, 22 from total of 108 respondents fall in a group of 26-30 years old, 25 from total of 108 respondents fall in a group of 31-35 years old, 17 from total of 108 respondents fall in a group of 36-40 years old, 15 from total of 108 respondents fall in a group of 41-45 years old, 5 from total of 108 respondents fall in a group of 46-50 years old, 5 from total of 108 respondents fall in a group of 51-55 years old and finally only three respondents from total of 108 respondents fall in a group of 56 years old and above. Concerning the of respondents’ marital status; it was found that 60 married respondents participated in this study and 48 single respondents participated in this study. Concerning the respondents’ level of education; it was found that 91 respondents from total of 108 respondents had obtained college degree, 13 respondents from total of 108
respondents had obtained master degree, and only four respondents from total of 108 respondents had obtained PhD degree.

</table>

The researcher implemented reliability analysis to (as seen in table-2) the values of Cronbach's Alpha for supervisor behaviour as independent factor, found to be .829 > .6 this indicates that the items used to measure supervisor behaviour factor were reliable for the current study, the values of Cronbach's Alpha for ethic & integrity as independent factor, found to be .770 > .6 this indicates that the items used to measure ethic & integrity factor were reliable for the current study, the values of Cronbach's Alpha for job empowerment as independent factor, found to be .741 > .6 this indicates that the items used to measure job empowerment factor were reliable for the current study, the values of Cronbach's Alpha for equal opportunity as independent factor, found to be .726 > .6 this indicates that the items used to measure equal opportunity factor were reliable for the current study, the values of Cronbach's Alpha for Personal development as independent factor, found to be .727 > .6 this indicates that the items used to measure Personal development factor were reliable for the current study, the values of Cronbach's Alpha for Nature of career as independent factor, found to be .751 > .6 this indicates that the items used to measure Nature of career factor were reliable for the current study, the values of Cronbach's Alpha for Development opportunity as independent factor, found to be .855 > .6 this indicates that the items used to measure Development opportunity factor were reliable for the current study, the values of Cronbach's Alpha for Workplace challenge as independent factor, found to be .835 > .6 this indicates that the items used to measure Workplace challenge factor were reliable for the current study, the values of Cronbach's Alpha for Employee recognition as independent factor, found to be .780 > .6 this indicates that the items used to measure Employee recognition factor were reliable for the current study, and the values of Cronbach's Alpha for Job satisfaction as dependent factor, found to be .773 > .6 this indicates that the items used to measure Job satisfaction factor were reliable for the current study. However, the results revealed that all items used to measure the relationship between nine independent factors and dependent factor were reliable for the current research.

</table>
The researcher attempted to find the correlation between nine independent variables and a dependent variable, therefore the correlation analysis was implemented (as seen in table-3). It was found that the value of Pearson correlation for equal opportunity = .521** > .01 therefore there is a positive and significant correlation between equal opportunity and job satisfaction, in terms of the strength it was found to be a moderate correlation, the value of Pearson correlation for personal influence = .650** > .01 therefore there is a positive and significant correlation between personal influence and job satisfaction, in terms of the strength it was found to be a strong correlation, the value of Pearson correlation for nature of career = .414** > .01 therefore there is a positive and significant correlation between nature of career and job satisfaction, in terms of the strength it was found to be a weak correlation, the value of Pearson correlation for development opportunity = .354** > .01 therefore there is a positive and significant correlation between development opportunity and job satisfaction, in terms of the strength it was found to be a weak correlation, the value of Pearson correlation for workplace challenge = .662** > .01 therefore there is a positive and significant correlation between workplace challenge and job satisfaction, in terms of the strength it was found to be a strong correlation, the value of Pearson correlation for employee recognition = .443** > .01 therefore there is a positive and significant correlation between employee recognition and job satisfaction, in terms of the strength it was found to be a weak correlation, the value of Pearson correlation for supervisor behaviour = .601** > .01 therefore there is a positive and significant correlation between supervisor behaviour and job satisfaction, in terms of the strength it was found to be a strong correlation, the value of Pearson correlation for ethics and integrity = .533** > .01 therefore there is a positive and significant correlation between ethics and integrity and job satisfaction, in terms of the strength it was found to be a weak correlation, the value of Pearson correlation for work challenge = .522** > .01 therefore there is a positive and significant correlation between work challenge and job satisfaction, in terms of the strength it was found to be a moderate correlation.
It was found that the value of R square = .542 (as seen in table-4) this indicates that 54% of the variables have been explained.

It was found the value F = 128.933 and since the value is greater than .001, this indicates that that there is a positive association between variables used to test research hypotheses.

The researcher utilized multiple regression analysis to find the most effective and suitable factors increasing level of job satisfaction in private companies in Kurdistan. It was found that the value of B for equal opportunity =.448 >.001 and P-value = .000, this indicated that there is positive relationship between equal opportunity and job satisfaction, accordingly the first research hypothesis was supported which stated that ‘Work engagement mediates the positive
relationship between equal employee opportunities (fair treatment) and job satisfaction”, the value of B for personal influence = .584 >.001 and P-value = .000, this indicated that there is positive relationship between personal influence and job satisfaction, accordingly the second research hypothesis was supported which stated that “Work engagement mediates the positive relationship between personal influence and job satisfaction”, the value of B for nature of career = .414 >.001 and P-value = .000, this indicated that there is positive relationship between nature of career and job satisfaction, accordingly the third research hypothesis was supported which stated that “Work engagement mediates the positive relationship between nature of career and job satisfaction”, the value of B for development opportunity = .269 >.001 and P-value = .000, this indicated that there is positive relationship between workplace challenge and job satisfaction, accordingly the fourth research hypothesis was supported which stated that “Work engagement mediates the positive relationship between workplace challenge and job satisfaction”, the value of B for employee recognition = .389 >.001 and P-value = .000, this indicated that there is positive relationship between employee recognition and job satisfaction, accordingly the sixth research hypothesis was supported which stated that “Work engagement mediates the positive relationship between employee recognition and job satisfaction”, the value of B for supervisor behaviour = .571 >.001 and P-value = .000, this indicated that there is positive relationship between supervisor behaviour and job satisfaction, accordingly the seventh research hypothesis was supported which stated that “Work engagement mediates the positive relationship between supervisor behaviour and job satisfaction”, the value of B for ethic and integrity = .446 >.001 this indicated that there is positive relationship between ethic and integrity and job satisfaction, accordingly the eighth research hypothesis was supported which stated that “Work engagement mediates the positive relationship between ethic and integrity and job satisfaction”, and the value of B for job empowerment = .497 >.001 and P-value = .000, this indicated that there is positive relationship between job empowerment and job satisfaction, accordingly the ninth research hypothesis was supported which stated that “Work engagement mediates the positive relationship between job empowerment and job satisfaction”.

IV. CONCLUSIONS

Employee engagement is a positive attitude towards the workplace and is the degree that an individual is bind to the organization. This research highlighted the significance of workplace challenge that inspires the individuals to be more engaged to their organization. Only small number of employees had participated in this research from private companies in Kurdistan, which limits the outcome of the study. The researcher used quantitative research method in order to measure the relationship between work engagement and job satisfaction, however only 108 respondents were participated in the current study. The researcher used multiple regression analysis to measure the relationship among variables, in private companies, most of the employees depend and get excited more upon the workplace challenge, and it demonstrates a positive indication of the employees revealing the attachment and engagement of employees to the organization. According to multiple regression analysis, the researcher found that workplace challenge had the highest value among other work engagement elements = .671 and P-value = .000, which indicates that many private companies’ employees are engaged to their job because of time management, Overwhelming workloads and communication.
